Task - 11

Use tkinter module for UI design

11.1

Aim: To use Tkinter module for UI design

Algorithm:

- 1) Import tkinter module
- 2) Create a main window
- 3) Create a label with desired text
- 4) Add the label to the main window using pack() method
- 5) Define a function to change font style
- 6) Start the main loop.

Program:

```
import tkinter as tk

# Function to change font style
def change_font():
    label.config(font=("Arial", 18, "bold"))

# Create main window
root = tk.Tk()

# Create label with desired text
label = tk.Label(root, text="Hello!!", font=("Helvetica", 14))

# Add label to main window
label.pack()

# Create button to change font style
button = tk.Button

# Add button to main window
button.pack()

# Start the main loop
root.mainloop()
```

of student disaffection was marginal. Many are still
positive about the program and the school.

Task-11.2

write a python GUI program to create three single line text-box to accept a value from the user tkinter module.

Algorithm:

- 1) Import the tkinter module
- 2) Create the main window
- 3) Add labels and text-boxes to the main window
- 4) Set the size of the text-boxes
- 5) Create a button to submit the values entered in the text-boxes
- 6) Get the values entered in the text boxes.

Program:

```
import tkinter as tk

# create the main window
root = tk.Tk()
root.title("Text-Box input")

# create labels and text-boxes
label 1 = tk.Label(root, text = "Enter value 1:")

entry 1 = tk.Entry(root)
label 2 = tk.Label
entry 2 = tk.Entry(root)

label 3 = tk.Label
entry 3 = tk.Entry(root)

# set the size of the text boxes
entry 1.config(width=30)
entry 2.config(width=30)
entry 3.config(width=30)

# create function to get the values entered in the
text boxes-
val 1 = entry 1.get()
val 2 = entry 2.get()
val 3 = entry 3.get()

# create a button to submit the values entered in
the text-boxes
submit_button = tk.Button(root, text = "submit")
```

Write a program that creates a new window
to display a value from the user's input while
the user is typing.

- 1) Import the tkinter module
- 2) Create the main window
- 3) Add labels and text boxes to the window
- 4) Add a button to the window
- 5) Create a function to handle the button click event
- 6) Call the function when the button is clicked

Output:

Enter value 1:
Enter value 2:
Enter value 3:
submit

Output 1: 10
Output 2: 20
Output 3: 30
Total = 60

Output 4: 10
Output 5: 20
Output 6: 30
Total = 60

Add the labels.

label 1.pack()

entry 2.pack()

label 2.pack()

entry 2.pack()

label 3.pack()

entry 3.pack()

Submit = button.pack()

Run the main event loop

root.mainloop()
